ABSTRACT

In speech sound waves, one word runs into the next seamlessly; there are not little silences between spoken words the way there are white spaces between written words. In the context (in connected speech) some words often sound completely different from the same words when they are spoken separately. So, the same words may carry different definitions. Sometimes, connected speech can lead to rather dramatic changes in the pronunciation of words, including the removal, addition, or alteration of sounds in other sounds or in combination. The given article deals with the contrast analysis of the main phonetic features of spontaneous speech, which include the processes of assimilation, reduction, and elision in English and Uzbek languages.

Keywords: Modification, connected speech, assimilation, reduction, elision.
