ABSTRACT

In order to think critically we need to examine ideas and evaluate them against what is already known and made decisions about their merits. The basic target of critical thinking is to try to move on of an objective position, when we consider all sides of an argument and evaluate its merits and demerits. This article discusses the psychological and pedagogical possibilities of developing critical thinking in primary school students and also some activities and methods to make learners think critically.

Keywords: Continuous education, critical thinking, innovative technologies.
