ABSTRACT

This study aims to see the relationship between social support and maternal acceptance of children with cerebral palsy at the clinic wisma bakti Bekasi. The data were obtained through distributing questionnaires to mothers with cerebral palsy children who were undergoing therapy at the clinic, so that 31 respondents were obtained using a census sampling technique. Based on the results of data analysis between the relationship between social support and maternal acceptance obtained Correlation coefficient (r) 0.304 and a significant level of $p < 0.1$. This shows that there is positive and significant direction, then H_0 is rejected and H_a is accepted, which means that there is a relationship between social support and acceptance of mothers who have cerebral palsy children at the clinic wisma bakti Bekasi.

Keywords: Cerebral Palsy, Social Support, Mother Acceptance.
