ABSTRACT

Agile processes in order that they are sustainable must have their components working in cohesion at a constant pace [1], the 8th principle of agile manifesto is critical from the perspective of sustainability. In real world scenario variations in delivery will be present no matter how much streamlining or automation is inculcated into systems. Introducing flexibility into systems will have to be investigated in some detail. We are attempting thus to bridge the gap between the two important parts or pillars of the 8th principle eventually.
